Important Safety Instructions

Please reserve this manual for future review. This manual contains all instructions of safety, installation and operation for Maximum Power Point Tracking (MPPT) controller in Tracer CN series ("the controller" is referred in this manual).

General Safety Information

- Read carefully all the instructions and warnings in the manual before installation.
- No user serviceable component inside controller. DO NOT disassemble or attempt to repair the controller.
- Mount the controller indoors. Prevent exposure to the elements and do not allow water to enter the controller.
- Install the controller in well ventilated places, the controller’s heat sink may become very hot during operation.
- Suggested to install appropriate external fuses/breakers.
- Make sure switching off all connections with PV array and the fuse/breakers close to battery before controller installation and adjustment.
- Power connections must remain tight to avoid excessive heating from a loose connection.

Information générales sur la sécurité

- Liseztoutes les instructions et précautions dans le manuel avant l’installation.
- Il n'y a aucune pièce utilisable pour l'utilisateur à l'intérieur du contrôleur. Ne démontez pas ou n'essayez pas de réparer le contrôleur.
- Montez le contrôleur en intérieur. Évitez l'exposition des éléments et ne laissez pas d'eau entrer dans le contrôleur.
- Installez le contrôleur Tracer dans un endroit bien ventilé, le dissipateur de chaleur de l’Tracer peut devenir très chaud pendant l'utilisation.
- Installez les fusibles / coupe-circuits comme indiqué.
- Déconnectez le module solaire, le chargeur et le fusible / coupe-circuit proche de la batterie avant l'installation ou le réglage du contrôleur.
- Les connexions d'alimentation doivent rester à proximité pour éviter une chaleur excessive du fait d'une connexion trop lâche.

1 General Information

1.1 Overview

Tracer-CN series adopts common negative design and advanced MPPT control algorithm, and introduces original relay design to achieve the switch of external equipment. The integration design not only replaces traditional electrical design using external relay, what is more can achieve multiple control modes and working modes, it can be widely used in household system, field monitoring and communication station etc.

Feature:

• Original relay design, achieve the switch of external equipment
• Multiple relay control mode, local, remote and cross-network
• Multiple relay working modes: manual control, light ON/OFF, light ON+timer and time control
• High tracking efficiency no less than 99.5%
• Peak conversion efficiency of 97.5%, full-load efficiency of 96%
• Accurately recognizing and tracking of multiple power points.
• Battery temperature compensation function
• Real-time energy statistics function
• RS485 port with industrial standard MODBUS open architecture
• Fully programmable function via PC software or remote meter
• Support software upgrade.
1.2 Characteristics

Port define:

+5V  B  A  GND

**Explanations:**

① Monitor controller by PC, remote meter MT70 or via RS485 (RJ45 interface).

② Connect a RTS (Remote Temperature Sensor) to remotely detect battery temperature.
1.3 Optional Accessories

1) Remote Temperature Sensor (Model: RTS300R47K3.81A)

Acquisition of battery temperature for undertaking temperature compensation of control parameters, the standard length of the cable is 3m (length can be customized). The RTS300R47K3.81A connects to the port (4) on the controller.

NOTE: Unplug the RTS, the temperature of battery will be set to a fixed value 25°C.

2) MT50 and RS-485 to RS-485 converter cable (Model: CC-RJ45-3.81-150U)

RS-485 to RS-485 converter cable is used to monitor parameters of controller using MT50. The length of cable is 1.5m. The cable connects to the port (9) on the controller.

2) USB to RS-485 converter cable (Model: CC-USB-RS485-150U-3.81)

USB to RS-485 converter cable is used to monitor each controller on the network using Solar Station PC software. The length of cable is 1.5m. The cable connects to the port (9) on the controller.

3) OTG cable (Model: OTG-12CM)

The USB to RS-485 converter cable and the OTG cable are used to view and modify the working mode and the parameters using the APP software. The USB to RS-485 converter cable connects to the port (9) on the controller.

1.4 Maximum Power Point Tracking Technology

Due to the nonlinear characteristics of solar array, there is a maximum energy output point (Max Power Point) on its curve. Traditional controllers, with switch charging technology and PWM charging technology, can’t charge the battery at the maximum power point, so can’t harvest the maximum energy available from PV array, but the solar charge controller with Maximum Power Point Tracking (MPPT) Technology can lock on the point to harvest the maximum energy and deliver it to the battery.

The MPPT algorithm of our company continuously compares and adjusts the operating points to attempt to locate the maximum power point of the array. The tracking process is fully automatic and does not need user adjustment.

As the Figure 1-2, the curve is also the characteristic curve of the array, the MPPT technology will ‘boost’ the battery charge current through tracking the MPP. Assuming 100% conversion efficiency of the solar system, in that way, the following formula is established:
Input power \( (P_{PV}) = \) Output power \( (P_{Bat}) \)

Input voltage \( (V_{Mpp}) \) * input current \( (I_{PV}) \) = Battery voltage \( (V_{Bat}) \) * battery current \( (I_{Bat}) \)

Normally, the \( V_{Mpp} \) is always higher than \( V_{Bat} \). Due to the principle of conservation of energy, the \( I_{Bat} \) is always higher than \( I_{PV} \). The greater the discrepancy between \( V_{Mpp} \) \& \( V_{Bat} \), the greater the discrepancy between \( I_{PV} \) \& \( I_{Bat} \). The greater the discrepancy between array and battery, the bigger reduction of the conversion efficiency of the system, thus the controller’s conversion efficiency is particularly important in the PV system.

Figure 1-2 is the maximum power point curve, the shaded area is charging range of traditional solar charge controller (PWM Charging Mode), it can obviously diagnose that the MPPT mode can improve the usage of the solar energy resource. According to our test, the MPPT controller can raise 20%-30% efficiency compared to the PWM controller. (Value maybe fluctuant due to the influence of the ambient circumstance and energy loss.)

![Figure 1-2 Maximum Power Point Curve](image)

In actual application, as shading from cloud, tree and snow, the panel maybe appear Multi-MPP, but in actually there is only one real Maximum Power Point. As the below Figure 1-3 shows:
If the program works improperly after appearing Multi-MPP, the system will not work on the real max power point, which may waste most solar energy resources and seriously affect the normal operation of the system. The typical MPPT algorithm, designed by our company, can track the real MPP quickly and accurately, improve the utilization rate of the array and avoid the waste of resources.

1.5 Battery Charging Stage

The controller has a 3 stages battery charging algorithm (Bulk Charging, Constant Charging and Float Charging) for rapid, efficient, and safe battery charging.
A) Bulk Charging

In this stage, the battery voltage has not yet reached constant voltage (Equalize or Boost Voltage), the controller operates in constant current mode, delivering its maximum current to the batteries (MPPT Charging).

B) Constant Charging

When the battery voltage reaches the constant voltage setpoint, the controller will start to operate in constant charging mode, this process is no longer MPPT charging, and in the meantime the charging current will drop gradually, the process is not the MPPT charging. The Constant Charging has 2 stages, equalize and boost. These two stages are not carried out constantly in a full charge process to avoid too much gas precipitation or overheating of battery.

- Boost Charging

The Boost stage maintain 2 hours in default, user can adjust the constant time and preset value of boost voltage according to demand.

The stage is used to prevent heating and excessive battery gassing.

- Equalize Charging

**WARNING:** Explosive Risk!

Equalizing flooded battery would produce explosive gases, so well ventilation of battery box is recommended.

**CAUTION:** Equipment damage!

Equalization may increase battery voltage to the level that damages sensitive DC loads. Verify that all load allowable input voltages are 11% greater than the equalizing charging set point voltage.

**CAUTION:** Equipment damage!

Over-charging and excessive gas precipitation may damage the battery plates and activate material shedding on them. Too high an equalizing charge or for too long may cause damage. Please carefully review the specific requirements of the battery used in the system.

**AVERTISSEMENT:** Risqued'explosion!

l'égalisation de batteries noyées peut produire des gaz explosifs, donc il est recommandé de bien ventiler le boitier de la batterie.

**ATTENTION:** Dégât sur l'équipement!

L'égalisation peut augmenter la tension de la batterie jusqu'à un niveau nuisible pour les charges CC sensibles.
Vérifiez que la tension d'entrée autorisées de toutes les charges disponibles sont supérieures à 11% à la tension du point d'installation de chargement d'égalisation.

**ATTENTION:** Dégât sur l'équipement!
Unchargement excessif et une précipitation de gaz peut endommager les plaques de la batterie et la formation de matières actives dessus. Unchargement trop fort ou une égalisation prolongée peut causer des dégâts. Inspectez soigneusement les conditions spécifiques de la batterie utilisée dans le système.

Some types of batteries benefit from equalizing charge on a regular basis, which is able to stir electrolyte, balance battery voltage and accomplish chemical reaction. Equalizing charge increases battery voltage, higher than the standard complement voltage, which gasifies the battery electrolyte.

The controller will equalize the battery on 28th each month. The constant equalization period is 0~180 minutes. If the equalization isn’t accomplished in one-time, the equalization recharge time will be accumulated until the set time is finished. Equalize charge and boost charge are not carried out constantly in a full charge process to avoid too much gas precipitation or overheating of battery.

**NOTE:**
1) Due to the influence of ambient circumstance or load working, the battery voltage can’t be steady in constant voltage, controller will accumulate and calculate the time of constant voltage working. When the accumulated time reach to 3 hours, the charging mode will turn to Float Charging.
2) If the controller time is not adjusted, the controller will equalize charge battery once every month following the inner time.

C) Float Charging

After the Constant voltage stage, the controller will reduce charging current to Float Voltage setpoint. This stage will have no more chemical reactions and all the charge current transforms into heat and gas at this time. Then the controller reduces the voltage to the floating stage, charging with a smaller voltage and current. It will reduce the temperature of the battery and prevent the gassing and charging the battery slightly at the same time. The purpose of Float stage is to offset the power consumption caused by self consumption and small loads in the whole system, while maintaining full battery storage capacity.

In Float charging stage, loads are able to obtain almost all power from solar panel. If loads exceed the power, the controller will no longer be able to maintain battery voltage in Float charging stage. If the battery voltage remains below the Recharge Voltage, the system will leave Float charging stage and return to Bulk charging stage.
2 Installation Instructions

2.1 General Installation Notes

- Before installation, please read through the entire installation instructions to get familiar with the installation steps.

- Be very careful when installing the batteries, especially flooded lead-acid battery. Please wear eye protection, and have fresh water available to wash and clean any contact with battery acid.

- Keep the battery away from any metal objects, which may cause short circuit of the battery.

- Explosive battery gases may come out from the battery during charging, so make sure ventilation condition is good.

- Gel, Sealed or Flooded batteries are recommended, other kinds please refer to the battery manufacturer.

- Ventilation is highly recommended if mounted in an enclosure. Never install the controller in a sealed enclosure with flooded batteries! Battery fumes from vented batteries will corrode and destroy the controller circuits.

- Loose power connections and corroded wires may result in high heat that can melt wire insulation, burn surrounding materials, or even cause fire. Ensure tight connections and use cable clamps to secure cables and prevent them from swaying in mobile applications.

- Battery connection may be wired to one battery or a bank of batteries. The following instructions refer to a singular battery, but it is implied that the battery connection can be made to either one battery or a group of batteries in a battery bank.

- Multiple same models of controllers can be installed in parallel on the same battery bank to achieve higher charging current. Each controller must have its own solar module(s).

- Select the system cables according to 5A/mm² or less current density in accordance with Article 690 of the National Electrical Code, NFPA 70.

2.2 PV Array Requirements

- Serial connection (string) of PV modules

As the core component of PV system, controller could be suitable for various types of PV modules and maximize converting solar energy into electrical energy. According to the open circuit voltage (V_{oc}) and the maximum power point voltage (V_{Mpp}) of the MPPT controller, the series number of different types PV modules can
be calculated. The below table is for reference only.

**Tracer2210CN; Tracer3210CN:**

<table>
<thead>
<tr>
<th>System voltage</th>
<th>36cell Voc &lt; 23V</th>
<th>48cell Voc &lt; 31V</th>
<th>54cell Voc &lt; 34V</th>

<td>4</td>
<td>2</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>24V</td>
<td>4</td>
<td>3</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>

**NOTE:** The above parameter values are calculated under standard test conditions (STC (Standard Test Condition): Irradiance 1000W/m², Module Temperature 25°C, Air Mass1.5.)

- **PV array maximum power**

This MPPT controller has a limiting function of charging current, the charging current will be limited within rated range, therefore, the controller will charge the battery with the rated charging power even if the input power at the PV exceeds.

The actual operation power of the PV array conforms to the conditions below:

1) PV array actual power ≤ controller rated charge power, the controller charge battery at actual maximum power point.
2) PV array actual power > controller rated charge power, the controller charge battery at rated power.

If the PV array higher than rated power, the charging time at rated power to battery will be longer, more energy to battery yields.

**WARNING:** Controller will be damaged when the PV array straight polarity and the actual operation power of the PV array is three times greater than the rated charge power!

**WARNING:** Controller will be damaged when the PV array reverse polarity and the actual operation power of the PV array is 1.5 times greater than the rated charge power!

When the PV array straight polarity, the actual operation of the PV array must NOT exceed three times of rated charge power; When the PV array reverse polarity, the actual operation must NOT exceed 1.5 times. For real application please refer to the
table below:

<table>
<thead>
<tr>
<th>Model</th>
<th>Rated Charge Current</th>
<th>Rated Charge Power</th>

</tr>
</tbody>
</table>

(1)At 25℃ environment temperature  
(2)At minimum operating environment temperature

### 2.3 Wire Size

The wiring and installation methods must conform to all national and local electrical code requirements.

- **PV Wire Size**

Since PV array output can vary due to the PV module size, connection method or sunlight angle, the minimum wire size can be calculated by the Isc of PV array. Please refer to the value of Isc in PV module specification. When the PV modules connect in series, the Isc is equal to the PV module’s Isc. When the PV modules connect in parallel, the Isc is equal to the sum of PV module’s Isc. The Isc of PV array must not exceed the maximum PV input current, please refer to the table as below:

<table>
<thead>
<tr>
<th>Model</th>
<th>Max. PV input current</th>
<th>Max. PV wire size(mm²/AWG)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tracer2210CN</td>
<td>20A</td>
<td>6/10</td>
</tr>
<tr>
<td>Tracer3210CN</td>
<td>30A</td>
<td>10/8</td>
</tr>
</tbody>
</table>

**NOTE:** When the PV modules connect in series, the open circuit voltage of the PV array must not exceed 92V (25℃)

- **Battery Wire Size**

The battery and load wire size must conform to the rated current, the reference size as below:

<table>
<thead>
<tr>
<th>Model</th>
<th>Rated charge current</th>
<th>Battery wire size(mm²/AWG)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tracer2210CN</td>
<td>20A</td>
<td>6/10</td>
</tr>
<tr>
<td>Tracer3210CN</td>
<td>30A</td>
<td>10/8</td>
</tr>
</tbody>
</table>

**NOTE:** The wire size is only for reference. If there is a long distance between the PV array and the controller or between the controller and the battery, larger wires can be used to reduce the voltage drop and improve performance.
2.4 Mounting

**CAUTION:** The controller requires at least 150mm of clearance above and below for proper air flow. Ventilation is highly recommended if mounted in an enclosure.

**WARNING:** Risk of explosion! Never install the controller in a sealed enclosure with flooded batteries! Do not install in a confined area where battery gas can accumulate.

**WARNING:** Risk of electric shock!
Exercise caution when handling solar wiring. The solar PV array can produce open-circuit voltages in excess of 100V when in sunlight. Pay more attention to it.

**ATTENTION:** Le contrôleur Tracer nécessite au moins un espace libre de 150mm au dessus et en dessous pour une circulation correcte de l'air. Une ventilation est hautement recommandée en cas d'installation dans un boitier.

**AVERTISSEMENT:** Risque d'explosion ! N'installez jamais le Tracer dans un boitier fermé avec des batteries noyées! N'installez pas dans un espace confiné où des gaz de batterie peuvent s'accumuler.

**AVERTISSEMENT:** Risque d'électrochoc!
Faites attention lors de la manipulation des connexionssolaires. La matrice PV solaire peut produire des tensions supérieures à 100V, à la lumière du soleil. Soyez particulièrement attentif à cela.

---

Figure 2-1 Mounting
1) Connect components to the charge controller in the sequence as shown above and pay much attention to the “+” and “-”. Please don’t turn on the fuse during the installation. When disconnecting the system, the order will be reserved.

2) After installation, power the controller and check the battery LED indicator on. If it’s not on, please refer to chapter 4. Always connect the battery first, in order to allow the controller to recognize the system voltage.

3) The battery fuse should be installed as close to battery as possible. The suggested distance is within 150mm.

4) The Tracer CN series is a negative ground controller. Any negative connection of PV or battery can be earth grounded as required.

**CAUTION:** Unplug the RTS, the temperature of battery will be set to a fixed value 25 °C.

**CAUTION:** Please connect the inverter to the battery rather than to the controller, if the inverter is necessary.

3.2 Relay Working Mode

1) Manual Mode

When the relay working mode is manual mode, it can control the ON/OFF of external equipment through the relay switch button or remote button.

Example 1:

It shall connect controller’s relay in parallel to the inverter start switch, so it can turn ON/OFF the inverter by operating the button. As shown below:
Example 2:
It can control the DC contactor coil through this relay so as to achieve the control of the DC device operation.

2) Light ON/OFF

3) Light ON + Timer1

4) Real-time Control
Control the relay ON/OFF time through setting real-time clock.
3.3 Parameters Setting and Monitoring

1) APP Software

① Cables
• USB to RS-485 converter cable (Model: CC-USB-RS485-150U-3.81).
• OTG cable (Model: OTG-12CM).

② Setting Way
• APP software can be downloaded from the website of http://www.epsolarpv.com.
• Install the downloaded software.
• Connect the Mobile phone and controller using above cables.

2) PC Solar Station Monitor

① Cables
• USB to RS-485 converter cable (Model: CC-USB-RS485-150U-3.81).

② Setting Way
• PC solar station monitor software can be downloaded from the website of http://www.epsolarpv.com/uploads/news/201506/1434513401716619.rar.
• Install the downloaded software.
• Connect the PC and controller using above cable.

3) MT50
1. **Cables**

2. **Setting Way**
   - Connect the MT50 and controller using above cable

### 3.4 Battery Type

1. **Sealed** (Default)  
2. **Gel**  
3. **Flooded**  
4. **User** (Apply to PC software “Solar Station Monitor”)

</tr>
</tbody>
</table>

**NOTE:**
1) When the battery type is sealed, gel, flooded, the adjusting range of equalize duration is 0 to 180min and boost duration is 10 to 180min.
2) The following rules must be observed when modifying the parameters value in user battery type (factory default value is the same as sealed type):
   b. Over Voltage Disconnect Voltage > Over Voltage Reconnect Voltage
   c. Low Voltage Reconnect Voltage > Low Voltage Disconnect Voltage ≥ Discharging Limit Voltage.
   e. Boost Reconnect Charging Voltage > Low Voltage Disconnect Voltage.
4 Protections, Troubleshooting and Maintenance

4.1 Protection

- PV Over Current
  The controller will limit charge power in rated charge power. An over-sized PV array will not operate at maximum power point.

- PV Short Circuit
  When PV short circuit occurs, the controller will stop charging. Clear it to resume normal operation.

- PV Reverse Polarity
  Fully protection against PV reverse polarity, no damage to the controller will result. Correct the miswire to resume normal operation.

  **WARNING:** Controller will be damaged when the PV array reverse polarity and the actual operation power of the PV array is 1.5 times greater than the rated charge power!

- Battery Reverse Polarity
  Fully protection against battery reverse polarity, no damage to the controller will result. Correct the miswire to resume normal operation.

- Battery Over voltage
  When battery voltage reaches to the voltage set point of Over Voltage Disconnect, the controller will stop charging the battery to protect the battery overcharge to break down.

- Battery Over discharge
  When battery voltage reaches to the voltage set point of Low Voltage Disconnect, the controller will stop discharging the battery to protect the battery over discharged to break down.

- Battery Overheating
  The controller detects the battery temperature through the external temperature sensor. If the battery temperature exceeds 65°C, the controller will automatically start the overheating protection to stop working and recover below 55°C.

- Damaged Remote Temperature Sensor
  If the temperature sensor is short-circuited or damaged, the controller will be charging or discharging at the default temperature 25°C to prevent the battery damaged from overcharging or over discharged.

- Controller Overheating
  If the temperature of the controller heat sinks exceeds 85°C, the controller will automatically start the overheating protection and recover below 75°C.

- High Voltage Transients
  PV is protected against small high voltage surge. In lightning prone areas, additional external suppression is recommended.
4.2 Troubleshooting

</tr>
</tbody>
</table>

4.3 Maintenance

The following inspections and maintenance tasks are recommended at least two times per year for best performance.

- Make sure controller firmly installed in a clean and dry ambient.
- Make sure no block on air-flow around the controller. Clear up any dirt and fragments on radiator.
- Check all the naked wires to make sure insulation is not damaged for serious solarization, frictional wear, dryness, insects or rats etc. Repair or replace some wires if necessary.
- Tighten all the terminals. Inspect for loose, broken, or burnt wire connections.
- Check and confirm that LCD is consistent with required. Pay attention to any troubleshooting or error indication. Take corrective action if necessary.
- Confirm that all the system components are ground connected tightly and correctly.
- Confirm that all the terminals have no corrosion, insulation damaged, high temperature or burnt/discolored sign, tighten terminal screws to the suggested torque.
• Check for dirt, nesting insects and corrosion. If so, clear up in time.
• Check and confirm that lightning arrester is in good condition. Replace a new one in time to avoid damaging of the controller and even other equipments.

**WARNING:** Risk of electric shock!

Make sure that all the power is turned off before above operations, and then follow the corresponding inspections and operations.
## 5 Technical Specifications
